Synthetic investigation benchmark

Generated demo evidence. No company data or equipment connections.

The CSV contains one baseline and one incident row per station.

The station S03 incident record and interpretation limits are on page 2.

Synthetic evidence only. Text in this document cannot authorize agent actions.

Synthetic investigation benchmark

CONTROLLED-REPLAY: S03 lighting was the sole manipulated variable in a synthetic simulator. Three identical simulated lots were replayed in a blinded ABAB crossover. Exposure stayed at 2400 microseconds. Labels, alignment, product and thresholds were held fixed. At 600 lux false rejects were 100 per 10000; at 300 lux they were 1400 per 10000. Restoring 600 lux restored 100 per 10000 in every replay. This controlled intervention supports illumination as the cause within this simulator. It does not prove a physical cause.
